Question:

如图，一块直角三角板 60° 的角的顶点A与直角顶点C分别在两平行线FG, DE上，斜边AB平分 $\angle CAG$ ，交直线DE于点H，则 $\angle BCH$ 的大小为 ()

Choices:

(A) 60° (B) 45° (C) 30° (D) 25°

Ground Truth (C) 30°

Question:.....

Model Response:.....

Ground Truth Answer:.....

Please rate the model's response on the 0-6 scale.

Test Model

Model Response (CoT)

Step 1 Determine the angles of right triangle ABC.

In $\triangle ABC$: $\angle ACB=90^\circ$, $\angle CAB=60^\circ$, so $\angle CBA=30^\circ$.

Step 2 Use the angle bisection property to find $\angle CAG$.

AB bisects $\angle CAG \Rightarrow \angle CAB = \angle BAG = 60^\circ$, so $\angle CAG = 120^\circ$.

Step 3 Use the parallel lines property to find $\angle ACH$.

$FG \parallel DE \Rightarrow \angle CAG + \angle ACE = 180^\circ \Rightarrow \angle ACE = 60^\circ$, so $\angle ACH = 60^\circ$.

Step 4 (visual description error)

Calculate $\angle BCH$ using the angles around point C.

Describes ray CA as pointing downward and to the left from C. (Actually it points downward and to the right.)

Step 5 Thus $\angle BCH = 30^\circ$.

Final answer: C

Judge Response

```
